

No More Razer Bumps and Ingrown Hair with Electrolysis Hair Removal

Women are crazy about shaving their legs, arms, bikini lines, etc. to get smooth, hairless skin for aesthetic reasons, but men regularly shave their face and neck. Many of them suffer from problems like razor cuts and bumps, ingrown hair and even infections. One good solution for these problems is to remove the hair permanently. Licensed Electrologist Yuki Arai, L. E., C. P. E, shows us how effective and convenient electrolysis is for hair removal.

Electrolysis is the only FDA-approved method of permanent hair removal that removes individual hairs one at a time. While other hair removal methods such as lasers only work on the surface, electrolysis uses disposable needles to penetrate deeper into the skin, thus inducing more permanent effects. Electrolysis can be used on all skin types and doesn't damage your skin. Anyone can do it – people who have thick hair, thin hair, any color hair. For example, since laser is effective on pale skin with dark

hair, you might not get desirable results if you have light hair or dark skin with dark hair. However, electrolysis isn't affected by any of these factors. Also, there is no risk of hurting or burning your skin.

Currently electrolysis customers are mainly females, but according to Ms. Arai the number of male clients is also growing. "I have male clients who want to remove the hair around the nape of the neck, eyebrow, cheek, ear, and chest. The cases vary. Some clients remove hair only around the edges of the mouth because it's hard to shave that area. Some who have tattoos come here, and some who do triathlons come here, too," she says.

For hair removal she employs three types of needles, the kind depending on the client's skin type, hair type and the area. One person might have different skin sensitivity and hair types in different areas, so she carefully chooses which needle should be used. Also, how the hair grows in the follicle

affects the treatment method. "It can't be judged from the surface. Even if a person has straight hair, it does not always mean that the hair will grow straight from the hair root. Sometimes the path of the hair growing in the follicle is crooked. In that case, I have to utilize different methods."

Furthermore, what's unique about Ms. Arai is that she uses a two-handed technique. While most electrologists use their dominant hand only, she inserts the needle into the hair follicle to heat the hair with one hand and tweezes it out with another hand. This two-handed method can shorten the treatment time as well as keep clients comfortable.

NY Electrolysis

19 W. 21st St. #904, (bet. 5th & 6th Aves.) New York, NY 10010

 Appointment only / The first consultation is free

Electrolysis Trial Session Manuel Compass tried electrolysis, showing how it works and sharing how he felt.

Fill out the form: The first step is to give information to the practitioner. It's important, so don't tell a lie!

Consulting: Ms. Arai gives a thorough explanation how electrolysis works and listens to Manuel's requests. The first consultation is free.

Hair and skin examination: She examines his hair and the skin around the area he wants to receive treatment. The back of the neck is a sensitive area, so she chooses a type of needle insulated with a special coating all over it.

Treatment: After inserting the needle into the follicle and destroying the roots by electric current, she tweezes out the hair.

"You can see a huge difference!"

Manuel Compass

My neck is sensitive compared to my head, so when I shave this area the hair grows back on the skin again and I have bumps from ingrown hairs. Instead of doing that all the time, I decided to have the hair completely removed so I don't have to keep shaving and getting bumps. I was a little bit nervous at first because I didn't know what to expect, but it actually didn't hurt at all. It's like a little pinch, and there's no pain. After the treatment I can see a huge difference. It's definitely smooth!

After the treatment: The target area becomes red right after the treatment, but there's no pain. Applying a soothing ointment will make it heal in a day.

Treatment: Her two-handed method is efficient in treating each hair.
